The invention relates to a method of determining the angiogenic index of a tissue or cell sample comprising assessing, in a sample, the expression levels of one or more differentially-expressed gene from any of 34 DNA sequences, given in the specification, where the levels are indicative of the angiogenic index. The methods and compositions of the present

invention are useful for diagnosing, preventing and/or treating canc coronary artery disease, myocardial ischemia or coronary arteriosclerosis. They can also be used in research, drug discovery forensic medicine involving angiogenesis. This sequence corresponds one of the differentially expressed proteins of the invention.

The invention relates to 2495 novel polymucleotides (I) and their encoded polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% or 90% identity to the nucleotide and protein sequences. The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or moxpid states. They are also useful for tracting osteoprosis, neurological diseases, Alzhaimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a protein

This invention relates to a novel isolated polymucleotide comprising a nucleotide sequence selected from one of 1680 sequences, a mature protein coding portion of them, an active domain of them and thehr complementary sequences. The invention may be useful for the production of compounds with an antiarthritic, antiparkinsonian, neuroprotective, nootropic, antibacterial, antiviral, antiparatic, antiparasitic activity. In addition, the disclosed sequences may be useful for gene therapy. The polypeptides or their antibodies are useful for treating many diseases bench as arthritis, Parkinson's, Alzheimer's, autoimmune diseases, cancer, psoriasis, inflammatory bowel disease and infections caused by bacteria, viruses, fungi or parasites. The present sequence is that of a human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    QGHATPALPFKETQELLLSPLPQEGPGSLAAGESSSLSASTSVSDSSQKKEEHNYSLFVS 184

The present invention relates to novel human coding sequences (ABQ99268-ABQ9608) and proteins (ABP64682-ABP65022). The sequences are useful in therapeutic, diagnostic and research methods. The polymucleotides may be used in the field of molecular biology as hybridisation probes, primers for PCR, for chromosome and game mapping, for the recombinant production of protein, or in generation of anti-sense DNA or RNA. The colymucleotides are useful in diagnostics as expressed sequence tags (SSTS) for identifying expressed genes or Ear physical mapping of the human genome. The proteins may be used as molecular weight markers, or and expand cell population in a toripotential or pluripotential state useful for re-engineering damaged or diseased tissues, transplantation, manufacture of bio-pharmaceuticals or the development of bio-sensors. The polymucleotides and proteins are useful for preventing, treating or ameliorating disorders involving aberrant protein expression or biological activity, e.g. haematopoietic disorders, central/peripheral corrections system diseases, mechanical and traumatic disorders, non-healing wounds, immune deficiencies and disorders, infectious diseases caused by viral, bacterial or fungal infection, autoimmune disorders, allergic tractions and conditions, conduction, autoimmune disorders, allergic reactions and conditions, conduction, autoimmune disorders, allergic tractions and conditions, conduction, autoimmune disorders, allergic
                                                                                                                                                                    Human, expressed sequence tag; EST; haematopoietic disorder; central nervous system disease; viral infection; deriphentions described peripheral nervous system disease; non-healing wound; infectious disease; immune deficiency; immune disorder; bacterial infection; allergy; cancer; fungal infection; autoimmune disorder; coagulation disorder; nootropic; antialinflammatory; immunosuppressive; neuroprotective; cytostatic; haemostatic; virucide; antibacterial; fungicide; immunostimulant; cerebroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polymucleotide sequences of the invention were assembled from ESTs isolated mainly by sequencing by hybridisation, and in some cases, sequences obtained from one or more public databases. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fire thy wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Zhao QA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polynucleotide, useful in research, diagnostic or therapeutic methods, e.g. preventing or treating disorders involving aberrant protein expression or biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Zhang J,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         36.6%; Score 865; DB 5; Length 168; 100.0%; Pred. The polypeptides and polynucleotides are useful for treating and diagnosing immune related disorders in mammals. The immune related disorders include systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, systemic sollerosis, Sjogren's syndrome, vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central or peripheral nervous system, demyelinating diseases of the Guillain-Barre syndrome and chronic inflammatory demyelinating polyneuropathy, polyneuropathy. This sequence represents a human PRO polypeptide of the

theorem is the contracted nuclear antigen (LANA). KSHV is also known as thuman Herpes virus as (HANA) and belongs to the rindino virus, or gamma-2 herpes virus class. The LANA protein is necessary for the efficient persistence of rhadino virus DNA in mammalian cells. Persistent rhadino virus infection is implicated in a variety of diseases e.g. Kaposi's Sarcoma (KS), Primary Effusion Lymphoma (PEL) and multicentric Castleman's disease. In addition, KS is a common malignancy in HIV patients. KSHV persists in host cells in a latent form. One of the few penes expressed from the latent viral DNA is LANA. LANA associates with both human chromosomes and with the rhadino virus cis-acting element (RVCAB), thereby providing a tethering function: the KSHV DNA episome is "tied" to the host chromosomes. This allows the viral DNA to persist in the host call. The present sequence may be used to screen and identify molecules that inhibit LANA interaction with RVCAB, thereby interfering with the latency cycle of this virus. Potential antiviral treatments for the above mentioned diseases may therefore be based on LANA deregulation. (Updated on 12-SEB-2003 to standardise OS field)

buman herpes virus type 8 (HHVB, a gammalherpeavirus). HHVB plays an important role in the pathogenesis of AIDS-related Kaposi's sarcoma. The important role in the pathogenesis of AIDS-related Kaposi's sarcoma. The invention relates to a novel method of detecting the presence of human herpesvirus 8 in a biological sample using peptides representative of dominant antigenic regions of HHVB. The method comprises contacting one or more isolated, immunogenic HHVB peptides with an antibody-containing biological sample, and detecting the formation of a complex beeveen the presence of human herpesvirus 8. The detection of HHVB complex complex between the presence of human herpesvirus 8. The detection of HHVB complex infection can be used to diagnose AIDS-associated Kaposi's sarcoma. The HHVB expectific and the antibodies are useful therapeutically when for the passive immunisation of a human against HHVB infection, thereby reducing HHVB contacted disease. The detection assays are highly specific, sensitive and couract course accurate Early detection and treatment of Kaposi's sarcoma could diminish the severity of symptoms characterisations of Stin disorders. Previous assays for HHVB antibodies such as immunobloces and enzyme immunosassays lack the sensitivity and accuracy needed for reliable diagnosis of Kaposi's sarcoma. Further advantages of municable for repid throughput and screening of samples economically. Cubdated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     124 SSPYQDEEVISKTPTLAQLNSEDSQSVSDSLYYPDSLFSVKQNPLPSSFPGKKITSRAAA 183

The invention provides a composition comprising nucleic acid, histone H1 protein and expression vector operationally encoding a protein suitable for tethering the nucleic acid to the histone H1 protein, where the rethering protein is LANA. The composition is useful in aiding the retention of the viral DANA. The composition is useful in aiding the retention of the viral DNA in the host cell. The viral vector encodes a protein suitable for tethering DNA to Histone H1. Methods for screening correction suitable for tethering DNA to Histone H1. Methods for screening of viral proteins the method of viral transfer. The composition has applications to gene therapy, including the treatment of multiple sclerosis, sequence represents the amino acid sequence of the Kaposi,'s sarcoma sequence represents the amino acid sequence of the Kaposi,'s sarcoma antigen (LANA), which acts as a tethering protein. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           14;

The present invention describes a system (A) for maintaining a plasmid as an episome in mammalian cells, comprising the rhadinoviral sequence LANA (latency-associated nuclear antigon) of 3489 base pairs (see ABA93487, 51) expressed in the cell, and the rhadinoviral sequence RVCAE (rhadinoviral cis-acting element) of 801 base pairs (see ABA93488, S2) present in the plasmid Also describes is a method for maintaining a closed circular DNA in a cell by expressing (S1) in the cells and having (S2) as a cis-acting and maintenance sequence in the DNA. (A) is particularly used in gene therapy (or other gene transfer applications) persistence of gene therapy wetcors in cells. The present squence represents Kaposi's sarcoma-associated herpesvirus (KSHV, also called the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the present in the exemplification of the present in the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present in the exemplification of the present expectation of the present exemplification of the p

```

The invention relates to an assay for determining whether a compound modulates LANA (latency-associated nuclear antigen) from KSHV (Kaposi's sarcoma-associated nuclear antigen) from KSHV (Kaposi's mediated persistence in a mammalian cell of a DNA episome having RVCAE (rhadinovirus cis-acting element) by detecting whether the compound inhibits expression of a gene resident on that episome. Also included are maintaining a closed circular DNA in a mammalian cell in which LANA is expressed (by using RVCAE as the cis-acting origin and maintenance sequence) and maintaining a plasmid as an episome in a mammalian cell (comprising: (a) Expressing LANA in the cell; and (b) having RVCAE resident on the plasmid). Compounds identified as interfering with the interaction between LANA and RVCAE are useful in treating or preventing thatino virus infection (e.g. primary effusion lymphoma (PEL)). LANA acts in trans on a 0.8 Kb KSHY TR (terminal repeach) unit to mediate efficient

episome persistence. The present sequence represents KSHV LANA

Sequence 1162 AA;

                                                                                                                                                                                                                                                                                 The invention relates to a composition comprising a latency-associated nuclear antigen (LANA) nucleic acid having any of 14 fully defined acquences of 10-61 bp given in the specification (ADV68159-ADV68172). The methods and compositions of the present invention are useful for detecting compounds that are agonistic or antagonistic for the binding of viral genetic material to genomic host DNA, in particular for detecting compounds for treating tumor and viral infections. This sequence corresponds to the LANA protein from the Kaposi's sarcoma-associated herpesvirus (also called human herpesvirus 8). The LANA protein tethers the viral DNA to the human chromosomal structural protein histone H1.

the introduction interaction of the nucleic acid sequence. Also derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence that is differentially expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a compound that regulates the activity of one or more of the composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaccutical composition comprising the one or more polypucleotides or their antibodies. The polymucleotide or more of modulates its activity is useful for preparing a medicament for treating contains an activity is useful for preparing a medicament for treating contains the polymucleotide or the compound that compare in the component and pharmaccutical composition and pharmaccutical composition and pharmaccutical composition and pharmaccutical composition and pharmaccutical composition comprising the one or more contains and a pharmaccutical composition and pharmaccutical composition and a pharmaccutical composition and a pharmaccutical composition or more of the compound that the compound that the compound that the compound that the compound that the compound that the component and the component and the component and the component and the component and the component and the component and the component and the component and the component and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        189 KILQAEVPLSDCVQKASKPPSSTQIMVKTNMYHNEKVNFHVECKDYVKKAKVKINPVQQS 248

The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                129 DEEVISKTPTLAQLNSEDSQSVSDSLYYPDSLFSVKONPLPSSFPGKKITSRAAAPVCSS

polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating plan (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

```
The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence witch is differentially regulated in an animal subjected to pain and a skit to perform the method, an array, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of pain and a pharmaceutical composition comprising the one or more polypeptides or the compound that medicament for treating medicament for the polyment and that may may a method for produced the polymented part for presting a medicament for the presting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                            New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

```
The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide a host cell comprising the vector comprising the novel polymucleotide sequence which is differentially regulated in an animal subjected to pain and a compround postform the method, an array, a method for identifying a nucleotide sequence that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal compound that regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a paramaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polymetices its activity is useful for preparing a medicament for treating pain and a pharmaceutical composition comprising the one or more polymetices is activity is useful for preparing a medicament for treating pain (c.g. spinal segmental nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note:

The sequence data for this patent did not form part of the printed the unit of the printed or the comprised or the comprised or the comparing the note or the painted or the sequence data for this patent did not form directly from WIPO at the paint of the printed or the comparined or the comparined or the comparined or the comparined or the comparined or the comparined or the comparined or the sequence data for this patent end or more therapy.
                                                                                                                                                                                                                       Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            7.8%; Score 185.5; DB 7; Length 712; 33.3%; Pred. Sequence 2, Application US/09298568;
Sequence 2, Application US/09298568;
Patent No. 632792
GENERAL INFORMATION:
APPLICANT: Kieff, Elliott D.
APPLICANT: Kieff, Elliott D.
TITLE OF INVENTION: HIADINO VIRUS LANA ACTS IN TRANS ON A UNIT OF HIADINO TITLE OF INVENTION: VIRUS DNA TO MEDIATE EFFICIENT EPISOME PERSISTENCE FILE REFERENCE: 16412-10001R
CURRENT APPLICATION NUMBER: US/09/298,568
CURRENT APPLICATION NUMBER: US/09/298,568
CURRENT PILING DATE: 1999-04-21
EARLIER PILING DATE: 1999-11-19
NUMBER OF SEQ ID NOS: 3
SOFTWARE: PATENTIN USC: 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    124 SSPYQDEEVISKTPTLAQLNSEDSQSVSDSLYYPDSLFSVKQNPLPSSFPGKKITSRAAA 183
